Ans. The main difference between a diesel engine and a steam turbine is that in the diesel engine the chemical energy of combustion is released inside the cylinder whereas in case of steam turbine the

File Type PDF Diesel

Electric Plants A Practical

energy developed during combustion of fuel is first transformed into steam outside the turbine and then supplied to the turbine which in turn develops mechanical power in the turbine.

For example, natural gas combined-cycle plants and coal plants provide dispatchable baseload services to the grid and thus have similar LACE values, even if their LCOE values differ. A generator's avoided cost provides a proxy for the potential revenues from sales of electricity generated. As with LCOE, these revenues are converted
