Electrostatic Discharge (ESD) Suppression Design Guide. Electrostatic Discharge (ESD) is an electrical transient that poses a serious threat to electronic circuits. The most common cause is friction between two dissimilar materials, causing a buildup of electric charges on their surfaces. Typically, one of the surfaces is the human body, and it is not uncommon for this static charge to reach a potential as high as 15,000 volts.

Electrostatic Discharge (ESD) Protection Design Guide

Electrostatic discharge (ESD) protection design is needed for integrated circuits in CMOS technology. The choice for ESD protection devices in the CMOS technology includes diode, MOSFET, and silicon controlled rectifier (SCR). These ESD protection devices cause signal losses at high-frequency input/output (I/O) pads due to the parasitic capacitance.

ESD protection at circuit and assembly design: In order that electronics circuits can survive electrostatic discharges encounter in normal use, it is essential that protection is built in to the circuitry. This is normally important on any connections to the outside world. It is also necessary that sub-assemblies and boards have some measure of ESD protection so that when they are handled, the boards or sub-assemblies have some level of ESD protection.

Guide To Electrostatic Discharge ESD Protection

Apart from correctly designing the circuit itself for ESD suppression, the printed circuit board PCB design and layout is also very important. Effort invested in ensuring the PCB design meets the requirements for ESD suppression will save costly debugging later and will also improve the overall reliability of the final equipment as ESD problems will manifest themselves less.

Abstract: A codesign of an electrostatic discharge (ESD) protection device and a common-mode suppression circuit on printed circuit board (PCB) for high-speed input/output interfaces is introduced in this paper. The characteristic and the circuit model of the ESD protection device are investigated and applied into the design of the common-mode suppression circuit.

ESD generated by triboelectric charging of the human body is often the most troublesome problem for portable computers. 1 Energy imparted during a discharge is usually in the form of a rapidly rising high voltage pulse with a slow exponential tail. ESD pulses can be modeled with the switching circuit shown in Figure 397.3.
