Functions of one complex variable. John B. Conway. This book discusses a variety of problems which are usually treated in a second course on the theory of functions of one complex variable. It treats several topics in geometric function theory as well as potential theory in the plane. In particular it covers: conformal equivalence for simply connected regions, conformal equivalence for finitely connected regions, analytic covering maps, de Branges' proof of the Bieberbach conjecture ...

Functions of a Complex Variable Complex Algebra Formally, the set of complex numbers can be defined as the set of two-dimensional real vectors, $(x; y)$, with one extra operation, complex multiplication: $(x_1; y_1) \cdot (x_2; y_2) = (x_1 x_2 - y_1 y_2; x_1 y_2 + x_2 y_1)$: (1) Together with generic vector addition $(x_1; y_1) + (x_2; y_2) = (x_1 + x_2; y_1 + y_2)$; (2)

complex-valued functions in the space \mathbb{C}^n of n -tuples of complex numbers. (z_1, \dots, z_n) As in complex analysis of functions of one variable, which is the case $n = 1$, the functions studied are holomorphic or complex analytic so that, locally, they are power series in the variables z_i .

A complex function is a function from complex numbers to complex numbers. In other words, it is a function that has a subset of the complex numbers as a domain and the complex numbers as a codomain. Complex functions are generally supposed to have a domain that contains a nonempty open subset of the complex plane.
