Lymphocytic choriomeningitis, or LCM, is a rodent-borne viral infectious disease caused by lymphocytic choriomeningitis virus (LCMV). The primary host of LCMV is the common house mouse. It is estimated that 5 percent of house mice throughout the United States carry LCMV and are able to transmit the virus. Other rodents, such as hamsters, are not the natural carriers, but can become infected with LCMV from wild mice.

Mousepox is one of the most feared diseases of mice because of (a) the potential for explosive outbreaks in which mortality can approach 100%, (b) known major effects on research results, and (c) known serious problems of detection once latent infection becomes established in a mouse population (AALAS, 1981).

This volume parallels the three parts of the main volume. Part I, *Principles of Rodent Disease Prevention*, briefly examines the requirements for maintaining pathogen-free rodents, factors in designing health surveillance programs, and other laboratory management issues. Part II, *Disease Agents*, is an easy-to-use reference section, listing diagnosis and control methods, the potential for interference with research, and other factors for disease agents ranging from adenoviruses to tapeworms. It covers bacteria, viruses, fungi and common ectoparasites, and

endoparasites. Part III, Diagnostic Indexes, presents alphabetical listings of clinical signs, pathology, and research complications and lists infectious agents that might be responsible for each.

This new edition--a must for all researchers who use these lab animals-- provides practical suggestions for breeding, keeping, and identifying pathogen-free laboratory rodents. It contains three informative sections. The first, Principles of Rodent Disease Prevention, summarizes methods for eliminating infectious agents. It offers information on pathogen terminology; pathogen status of rodents; and breeding, transporting, isolating, testing, and diagnosing rodents. The second section, Individual Disease Agents and

medicine. Newly recognized infectious diseases continue to emerge and molecular methods for studying infectious agents are becoming widely used for the classification of these and previously known pathogens. With the ongoing development and perfection of genetic engineering techniques, the use of genetically engineered mice in the research laboratory continues to grow exponentially. This new edition features updates throughout with increased emphasis on timely topics such as infectious diseases in genetically engineered mice. Diseases covered include viral infections, bacterial infections, parasitic diseases, nutritional and metabolic disorders, behavioral disorders, aging and degenerative disorders, environment-related disease, and neoplasms. Organized by species, coverage

The Mouse in Biomedical Research, Volume II: Diseases is a compilation of papers detailing infectious diseases of the mouse. This compilation deals with bacterial, mycotic, viral, protozoal, rickettsial, parasitic, non-neoplastic, and metabolic diseases of the mouse. Several papers describe the different diseases found in the digestive, respiratory, urogenital, integumentary, central nervous, lymphoreticular, musculoskeletal, cardiovascular, and

And Rats endocrine systems of the mouse. This book lists the possible bacterial infections, as well as other miscellaneous infections such as those caused by aerosols, particles, and the air in the laboratory environment. This text also lists viruses that can affect the mouse such as the lactate dehydrogenase-elevating virus, mouse pox, polyomavirus, and the minute virus. This book describes the process of identification, diagnosis, epidemiology, treatment, control, prevention, and occurrence of these diseases. This text also reviews the diseases that can be transmitted from infected mice to humans, as well as through animal bites and allergic reactions. This book is suitable for researchers, clinical assistants, and scientists dealing with laboratory animals, particularly with
