Networking has become commonplace in the home. In years past, it took a trained technician to set up and manage a computer network; that's not the case anymore. With more and more households having multiple PCs, there is an increased demand to network those PCs to share files, peripherals, and an Internet connection. And it's become much easier to create a home network, thanks to easier-to-use wireless networking technologies and equipment. The problem is setting up a wireless network can still be somewhat confusing, and often difficult. Even setting up a simple wireless network to share an Internet connection can be a frustrating trial-and-error process. What kind of wireless network should you choose -- 802.11a, b, g, or n? What equipment do you need? How do you configure all your computers to work on the network? How do you share a single printer on your network? The confusion continues when one considers the different issues related to different operating systems. Setting up a wireless network under Windows Vista is much different than setting up a similar network under Windows XP. Users are looking for simple answers to all these questions. Unfortunately, most networking books today are geared toward technology-savvy networking professionals. Where does the average user turn to for solutions to his wireless networking problems? The answer is this book -- Wireless Networking with Windows Vista. This extraordinary book explains the engine that has catapulted the Internet from backwater to ubiquity!and reveals that it is sputtering precisely because of its runaway success. With the unwitting help of its users, the generative Internet is on a path to a lockdown, ending its cycle of innovation!and facilitating unsettling new kinds of control. iPods, iPhones, Xboxes, and TiVos represent the first wave of Internet-centered products that can't be easily modified by anyone except their vendors or selected partners. These !tethered appliances! have already been used in remarkable but little-known ways: car GPS systems have been reconfigured at the demand of law enforcement to eavesdrop on the occupants at all times, and digital video recorders have been ordered to self-destruct thanks to a lawsuit against the manufacturer thousands of miles away. New Web 2.0 platforms like Google mash-ups and Facebook are rightly touted!but their applications can be similarly monitored and eliminated from a central source. As tethered appliances and applications eclipse the PC, the very nature of the Internet!its !generativity,! or innovative character!is at risk. The Internet's current trajectory is one of lost opportunity. Its salvation, Zittrain argues, lies in the hands of its millions of users. Drawing on generative technologies like Wikipedia that have so far survived their own successes, this book shows how to develop new technologies and social structures that allow users to work creatively and collaboratively, participate in solutions, and become true !netizens.!
