

## Reif Problem Solutions 7

Yeah, reviewing a ebook **reif problem solutions 7** could amass your close links listings. This is just one of the solutions for you to be successful. As understood, completion does not recommend that you have astounding points.

Comprehending as capably as bargain even more than new will pay for each success. adjacent to, the revelation as with ease as insight of this reif problem solutions 7 can be taken as capably as picked to act.

## Fundamentals of Statistical and Thermal Physics - Reif

...

(a) According to Reif §2.5.14, the total number of states has the following dependence on  $V$ :  $\Omega(E) \propto V^{N_1+N_2}$  (b) We have  $p^- = \frac{1}{\beta} \frac{\partial \ln \Omega}{\partial V} = \frac{1}{\beta} \frac{\partial}{\partial V} [(N_1 + N_2) \ln V] = \frac{1}{\beta} \frac{N_1 + N_2}{V}$  (7) Hence we have the equation of state:  $p^- = \frac{N_1 + N_2}{V} kT$

Problem 7.3 Reif There are several ways to calculate the entropy differences that are asked for. One way is to use the formulas found in Ch. 5, specifically Eq.(5.4.4), for the change in entropy of ideal gases. Another is to use ideal gas expressions for  $S$  that are developed in Ch. 7 based on statistical mechanics, but you must

Physics 416/517: Problem Set #7. Due by 5 PM Friday, April 11 th, 2003. Reif, Problems 7.1, 7.3, 7.5, 7.7, 7.14, \* 7.20. Problem 7: \* The energy levels of a particle trapped in a cubical box of volume  $V = L^3$  are given by  $E_n = (2\pi^2/2mL^2)(n_x^2 + n_y^2 + n_z^2)$ . We can use this to model a single atom of helium trapped in a metal crystal.

Phys416/517: Problem Set #7

The first part of this problem is the solution to Reif 7.24, shown here Problem 7.24 Reif The conditions of the problem make it reasonable to treat the loss of molecules from the vessel as effusion. We can also assume the reverse flux from outside the container is negligible. Let  $N(t)$  be the number of molecules remaining ...

Problem 7.24 Reif

Problem 7.21 Reif We found in Problem 7.20b that the translational kinetic energy probability density  $\psi(\epsilon)$  for a gas with a Maxwellian speed distribution was given by the function  $\psi(\epsilon) = \frac{2\pi}{\sqrt{3}} \frac{1}{\pi kT} \sqrt{\epsilon} \exp[-\epsilon/kT]$ . (1) The most probable energy  $\epsilon$  is the one that maximizes the value of  $\psi(\epsilon)$ . Thus,

## Common iPhone 7 Problems and Solutions

$T = -T \left( \frac{\partial \mu}{\partial V} \right)_{T, p}$ , (7) which is one form of the answer. The problem did ask for an answer in terms of the thermal expansion coefficient  $\alpha$ , defined as  $\alpha = \frac{1}{V} \left( \frac{\partial V}{\partial T} \right)_{p}$ . (8) After substituting Eq.(8) into Eq.(7), we have  $\left( \frac{\partial \mu}{\partial p} \right)_T$ .
