In probability theory, a martingale is a sequence of random variables (i.e., a stochastic process) for which, at a particular time, the conditional expectation of the next value in the sequence, regardless of all prior values, is equal to the present value.

In probability theory, the central limit theorem says that, under certain conditions, the sum of many independent identically-distributed random variables, when scaled appropriately, converges in distribution to a standard normal distribution. The martingale central limit theorem generalizes this result for random variables to martingales, which are stochastic processes where the change in the ...

Notes on Elementary Martingale Theory. Notes on Elementary Martingale Theory. by John B. Walsh. 1 Conditional Expectations. 1.1 Motivation. Probability is a measure of ignorance. When new information decreases that ignorance, it changes our probabilities. Suppose we roll a pair of dice, but don't look immediately at the outcome. The result is there for anyone to see, but if we haven't yet looked, as far as we are concerned, the probability that a two ("snake eyes") is showing is the same ...

The notion of a martingale is one of the most important concepts in modern probability theory. It is basic in the theories of Markov processes and stochastic integrals, and is useful in many parts of analysis (convergence theorems in ergodic theory, derivatives and lifting in measure theory, inequalities in the theory of singular integrals, etc.).

Martingale - Encyclopedia of Mathematics

A martingale is any of a class of betting strategies that originated from and were popular in 18th-century France. The simplest of these strategies was designed for a game in which the gambler wins the stake if a coin comes up heads and loses it if the coin comes up tails. The strategy had the gambler double the bet after every loss, so that the first win would recover all previous losses plus win a profit equal to the original stake. The martingale strategy has been applied to roulette as well,

Martingales • For casino gamblers, a martingale is a betting strategy where (at even odds) the stake doubled each time the player loses. Players follow this strategy because, since they will eventually win, they argue they are guaranteed to make money! • A stochastic process $\{Z_n, n \geq 1\}$ is a martingale if $E[Z_n | \mathcal{F}_{n-1}] = Z_{n-1}$.
