This monitoring information will be used for calibration and modification of watershed models such as SWAT (Soil and Water Assessment Tool) for application to similar watersheds within the Chesapeake Bay region. Selected accomplishments: Improved SWAT model water budget estimation and evaluated potential use of REMM model in combination with SWAT: The application of the Soil and Water Assessment Tool (or SWAT) model to a watershed in Maryland resulted in an underestimation of the water ...

Watershed management implies an effective conservation of soil and water resources for sustainable production with minimum non point resources (NFS) pollutant losses. It involves management of land surface and vegetation so as to conserve the soil and water for immediate and long term benefits to the farmers, community and society as a whole.

Watershed Management: Meaning, Types, Steps, and Programmes

Automated watershed delineation & hydrologic modeling. Automatically delineate a watershed and sub-basins using digital terrain data. Automatically compute geometric basin data such as area, slope, mean elevation, maximum flow distance and more. With a small amount of input, compute hydrologic basin data such as time of concentration, curve number, and infiltration parameters.

Global NEWS-2 is an ideal tool for management purposes in data-poor regions such as China's coastal watersheds because it requires mainly social-economic input data and simple model parameters. The model has been applied to large Chinese rivers including the Pearl River (Strokal et al., 2015) and the Yangtze River (Yan et al., 2010).
